1. Runtime Authority and Interpretation

This file reports the effective live role-permission matrix. For roles with one or more `ur_role_permissions`, ACC/UR is exclusive. A role with zero UR grants falls back to legacy `role_permissions`. Active user overrides are applied after the role matrix; none existed at snapshot time. `DEPT_MANAGER` runtime stripping is reflected.

The merged Constitution contains the approved target governance. Differences shown here are current implementation/data conformance gaps, not silently inferred grants.

Permission entries marked `LEGACY_DB_ONLY` / `UNRESOLVED` exist in the live database but have no structured current-catalog meaning; the document does not invent one.

5. Required Governance / Conformance Review

- ADMIN remains active in assignments/memberships and receives legacy fallback permissions even though it is deprecated.
- RECEIVER and active E2E roles are live but noncanonical; they are listed rather than hidden.

- Live grants that differ from the v2.1 target matrix require ACC cleanup or explicit ratification.
- Currency mutation is currently SUPER_ADMIN role-gated rather than represented by a dedicated permission key.
- PERIOD_CLOSE_MANAGE remains accepted by current routes as legacy compatibility although granular permissions are the constitutional target.
- Uncataloged live permissions require a product decision; this document leaves their current source meaning unresolved.

6. Source-of-Truth References
